                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                can be use infection. Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  982 nucleotide sequences isolated from the Enterococcus faecalis genome X12938 to X13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for disgnosing Enterococcual infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             infection.

                                                                                                                                                                                      also transformed mammalian cells, used for alleviating symptoms of muscular dystrophy Claim 6; Fig 9; 78pp; English.

A utrophin gene (T74666) codes for a 395 kDa protein (W22017) that shows strong sequence similarity to dystrophin. A utrophin minigene (see also T74665) has been constructed with comprises approx. the first 2 kb and the last 4 kb of the full-length coding sequence. The smaller size of the minigene makes it suitable for cloning into viral vectors designed for specific tissue expression in muscular dystrophy gene therapy procedures. Utrophin nucleic acids and polypeptides are also useful in screening for substances that modulate utrophin binding to actin and/or the dystrophin

It comprises Arabidopsis thaliana EST Q_ATTS4954. Claimed antifungal proteins, including MS59 and its homologues encoded by isolated ESTS (see V27264-91) from Arabidopsis and rice, have a mol.wt. of 55-65 kba (SDS-PAGE), have carbohydrate oxidase activity, show anti-Phytophthora and/or anti-Pythium activity, show anti-Phytophthora end/or reduce susceptibility to infection by fungi, or expressed in host cells for use in antifungal compositions. Plants engineered to express the antifungal proteins require reduced treatments with fungicides and have a longer shelf-life.

Sequence 346 BP; 88 A; 54 C; 88 G; 108 T;
      Claim 1; Page 1354-1363; 2084pp; English.

A computer readable medium has been developed which has recorded 982 nucleotide sequences isolated from the Enterococcus faecalis X12938 to X13919 represent these nucleotide sequences which are purcleotide sequences, also known as contigs. The computer-based sequences, also known as contigs.
                                                                                                                                                    use in vac
infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ş
                                                                                                                                                                                                                                    pri polypeptide(s) - useful for vaccines to treat or prevent H. pylori pri infection, and to detect Helicobacter Claim 23; Page 851; 1481pp; English.

CC This sequence encodes a H. pylori secreted or periplasmic protein. CC The protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, CC useful as potential H. pylori life cycle activators or inhibitors. CC were proved to the pylori (ATCC 55679) was determined from CC overlapping contigs generated by mechanically shearing the bacterial CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To complete the pylori antigens for vaccine development, the amino cand sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be cisolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts.

The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for diagnosing Enterococcal infection in an animal and monitoring progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        H. pylori secreted or periplasmic protein ORF 07gel1504orf2. 3']; double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not and Eco RI sites of the modified pTTT3 vector. RNA provided by Dr. Bertrand Jordan. Library went through three rounds of normalization, and was constructed by Bento Soares and M.Fatima Bonaldo."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Conservative
                                              /note="vector: pAMP10; Site_1: Not1; Site_2: EcoRI; 1st strand cDNA was primed with oligo(dT)17 on 50 mg of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected cells histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ø

                                         /note="Vector: pAMP10; Site_1: Not1; Site_2: ECORI; 1st strand cDNA was primed with oligo(dT)17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected cells
histologically-determined to be fully malignant prostate cancer cells. Double-stranded cDNA was ligated to ECORI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

burgdorferi proteins that may have a role in chronic Lyme arthritis, we In an effort to implicate immune responses to specific Borrelia

whereas during maximal arthritis, the higher the IgG response to OspA and earlier in the infection, the milder and briefer the subsequent arthritis, duration of arthritis. Thus, the higher the IgG antibody response to P35 to a C-terminal epitope of OspA, correlated directly with the severity and maximal arthritis, the levels of IgG antibody to OspA and OspB, especially severity or duration of maximal arthritis. In contrast, during periods of the levels of 1gG antibody to P35 correlated inversely with the subsequent responses to OspA and OspB. During early infection and early arthritis, developed weeks later; and months to years later, 64% of patients had P37, and P41; reactivity with OspE, OspF, P39, and P93 often earliest responses were usually to outer surface protein C (OspC), P35, correlated with the severity and duration of maximal arthritis. The during early infection, early arthritis, and maximal arthritis, were antibody responses to 10 recombinant B. burgdorferi proteins, determined Lyme disease. In these patients, the immunoglobulin G (IgM) and IgG serial serum samples from 25 patients monitored throughout the course of studied the natural history of the antibody response to B. burgdorferi in

                                    flagellin proteins of other bacteria.
  the PFs of B. burgdorferi and that they are regulated differently from
          together, the results indicate that both Flam and Flam comprise
   was antigenically well conserved in several spirochete species. Taken
                   Treponema pallidum anti-Flam serum indicated that Flam
        regulated on the translational level. Western blot analysis using
                ofher spirochete flagellar proteins, Flah is likely to be
    These results suggest that, in agreement with data found for FlaB and
             the wild-type amounts, it failed to synthesize Flak protein.
         this mutant still synthesized flam message in amounts similar to
 spontaneously occurring PF mutant of B. burgdorferi (HB19Fla-). Although
              hyodysenteriae. We also tested if Flah was synthesized in a
      glycosylation, and thus it resembles its counterpart from Serpulina
               Flah, we found that it was posttranslationally modified by
         Flam was expressed at a lower level than Flab. In characterizing
                   to find Flak. Unlike other spirochetes, B. burgdorferi
 purify B. burgdorferi PFs, and our results explain in part their failure
            Flak in the isolated PFs. Sarkosyl has been used by others to
       the other hand, purifying the PFs by using Sarkosyl resulted in no
 purified with the PFs in association with the 41.0-kDa FlaB protein. On
                             PFs, we found that the 38.0-kDa Flah protein
  detail. Using Triton X-100 to remove the outer membrane and isolate the
          results led us to analyze the PFs and {\tt Flak} of B. burgdorferi in
expressed in B. burgdorferi and that it mapped in a fla/che operon. These
                  core of Flab. We recently found that a flah homolog was
         spirochete species are comprised of an outer layer of Flah and a
       only one flagellin protein (FlaB). In contrast, the PFs from other
burgdorferi flagellar filaments indicate that these organelles consist of
       and overlap in the center of the cell. Most descriptions of the B.
  flagella (PFs). The PFs are subterminally attached to the cell cylinder
     sheath, and within this sheath are the cell cylinder and periplasmic
     features common to other spirochete species. Outermost is a membrane

purified HGE agents. simpler serodiagnosis for HGE than the use of whole infected cells or rP44 protein as antigen would provide a more specific, consistent, and recombinant antigen per dot was used. The use of the affinity-purified densities of the dot reactions and the IFA titres when >50 ng of immunoblot assay. There was a positive correlation between the colour ranging from 1:20 to 1:2560 gave distinct positive reactions in a dot Sera from 20 HGE patients with indirect fluorescent-antibody (IFA) titres agent and B. burgdorferi reacted positively with rP44 and the HGE agent. serum reacted with rP44. Sera from 2 patients coinfected with the HGE chaffeensis serum nor rabbit anti-Borrelia burgdorferi that rP44 is an HGE-E. equi group-specific antigen. Weither human anti-E. horse anti-Ehrlichia equi serum recognized the rP44 protein. This suggests (from patients in New York State, USA), a horse anti-HGE serum, and a 38 kDa were recognized. 11 HGE patient serum samples agent strains tested except strain 2, in which 3 proteins of 42, 40, and anti-rP44 serum reacted with 44- to 42-kDa proteins in 6 different HGE dot blot immunoassay. Western immunoblot analysis showed that mouse affinity-purified rP44 was evaluated by Western immunoblot analysis and expressed by using expression vector pET30a. The reactivity of the the genome of the HGE agent. The recombinant 44-kDa protein (rP44) was results revealed the existence of multigenes homologous to the P44 gene in A gene encoding this protein was cloned and sequenced. Southern blot ehrlichiosis (HGE) agent is an immunodominant antigen in human infection.
